CSUSM STEAM AMBASSADORS

Help our pollinators!

Pollinators include some animals, like bats, and insects like butterflies and bees, that move pollen grains from flower to flower to help them grow. In recent years, pollinators like the monarch butterfly have begun to disappear.

Milkweed is the ONLY plant monarch caterpillars eat. This special plant provides all the nutrients a caterpillar needs to transform into an adult butterfly. Due to loss of habitat, milkweed has also begun to rapidly disappear.

Plant these seeds in full sunlight at a depth of 1/4 of an inch in nice dark soil
