Research Seminar Series

Tijuana River and the Environmental Structural Violence Among the Deported Population That Inhabit It

Dr. Alhelí Calderón-Villarreal

This talk explores the findings from the Socio-Environmental Tijuana River Project, a binational study on substance use, migration, homelessness, and environmental health through the lens of Environmental Structural Violence. The research reveals systemic health disparities, water contamination, stigma, and political-economic factors impacting deported populations along the Tijuana River, developed in collaboration with scholars and community organizations across the US-Mexico border.
